boundary value problem is a differential equation together with a set of additional constraints, called the boundary conditions. A solution to a boundary value problem is a solution to the differential equation which also satisfies the boundary conditions. Boundary value problems arise in several branches of physics as any physical differential equation will have them. Problems involving the wave equation, such as the determination of nor

Equations (2.1b) and (2.2b) are called boundary conditions (BCs) since information is provided at the ends of the interval, i.e.,  $atx=a$  and  $bx=b$ . The conditions (2.1b) and (2.2b) are called nonseparated BCs since they can involve a combination of information at  $x=a$  and  $x=b$ .
