Finally, the increased temperature of hypersonic flows mean that real gas effects become important. For this reason, research in hypersonics is often referred to as aerothermodynamics, rather than aerodynamics. The introduction of real gas effects means that more variables are required to describe the full state of a gas.

DESCRIPTION: Hypersonic ground test facilities used in the development of high-speed flight systems currently lack a comprehensive suite of pressure, temperature, and gas mixture composition sensing systems that are able to survive long durations (5+ minutes) in high pressure (2000 psi) and temperature (4000 Å , ° F) environments.

Sensors for High Pressure and Temperature Hypersonic ...

The hypersonic flow exists mostly in a thermodynamic nonequilibrium state; the only correct nomenclature shall be the high-enthalpy gas dynamics. It arises from the fact that the internal structure of collision gaseous particles must be entered into consideration, in other words, the microscopic interactions between gases are inelastic collisions.

High-enthalpy hypersonic flows | Advances in Aerodynamics ...

When operating any hypersonic facility, the gas needs to have a high temperature. Temperature and pressure are exchanged for velocity; consequently, the gas must start at a high temperature. In any scenario where there are high pressures and high temperatures, there is a risk of something exploding or burning.
