Hydrates are named by the ionic compound followed by a numerical prefix and the suffix "-hydrate." The "nH<sub>2</sub>O" notation indicates that "n" (described by a Greek prefix) number of loosely bonded water molecules are associated per formula unit of the salt. An anhydride is a hydrate that has lost water.

Chemistry: Hydrates Flashcards | Quizlet

The ionic compound (without the waters of hydration) is named first by using the rules for naming ionic compounds (e.g., Ba(OH)<sub>2</sub> • 8H<sub>2</sub>O = "barium hydroxide"). Rule 2. Greek prefixes are attached to the word "hydrate" to indicate the number of water molecules per formula unit for the compound (e.g., Ba(OH)<sub>2</sub> • 8H<sub>2</sub>O; 8 water molecules = "octa hydrate").
