Psychosomatic Factors in Dermatology
In dermatology like in general medicine, the term "psychosomatic" generally refers to any somatic disorder with objectively observable anatomoclinical or biological changes triggered essentially by psychological factors (events experienced, stress, personality traits or social environment of the subject). However, in various works carried out in this field of dermatology, the concept of "psychodermatology", which was invented by the Anglo-Saxons, is gradually replacing the term ...

Corticosteroids used in dermatological disorders may cause psychiatric symptoms, such as cognitive impairment, mood disorders, depression, delirium, and psychosis. Psychiatric disturbances as a result of dermatological medications are still not fully understood.

Psychodermatology: When the Mind and Skin Interact ...
Abstract. • Few experienced clinicians remain unimpressed both by the influence of psychological and social factors on the physical state and by our relative inability to deal adequately with this aspect of the practice of dermatology. This article reviews the historical development of psychosomatic concepts, describes some theories concerning the process whereby somatization takes place and why a particular disease is "chosen," reviews some of the relevant basic science findings, offers a ...

Psychosomatic Concepts in Dermatology: A Dermatologist ...
A dermatologist treats your skin but in reality they treat far more. Our skin has an aesthetic value and is a significant factor in how we feel about ourselves, impacting on our personal, or social lives. That people with visible conditions on their face, or hands have greater psychological issues is no surprise.

Psychosomatic factors in dermatology.
Multifactorial dermatologic disorders, which can besubstantially influenced by psychological factors (e.g. atopic dermatitis,psoriasis, chronic urticaria etc.); (3.) Psychic disorders developing as aconsequence of disfiguring or life-threatening dermatoses (e.g. adjustmentdisorder, depressive disorder, anxiety disorder); (4.)

[Psychosomatic dermatology - state of the art].
In humans, psychosomatic status and psychosocial factors were observed to be good predictors of histamine-induced itch and flare. 6 When patients with atopic dermatitis were purposely informed before their histamine prick test that histamine-induced itch is uncontrollable and unpredictable, 90% of them had increased itch and/or increased urticaria. 7 In addition, the anticipation of developing itch already caused the subjects to scratch.

Psychosomatic factors in pruritus - ScienceDirect
Google Scholar. In pruritic skin diseases, such as atopic dermatitis and psoriasis, the severity of the diseases do not adequately account for the intensity of itch reported by patients, and psychological factors have often been attributed to being responsible for the perception of pruritus. 2. Verhoeven L.
