The advantages of supercritical microemulsions over
conventional liquid or aqueous based systems are
mentioned as—energy savings, environmental
benefits since the fluids may be benign and the
contaminants or surfactants can more easily be
recovered, microemulsions have a high capacity for
oils or other lipophilic materials, the selectivity for the
contaminants may be adjusted by density
manipulation, and improved cleaning or extraction
efficiency because of the high diffusivities and low ...

~~Supercritical Fluid Extraction: Principles and Practice ...~~

Supercritical fluid extraction using carbon dioxide (CO₂) has been recognized as a green technology. It is a clean and versatile solvent with gas-like diffusivity and liquid-like density in the supercritical phase, which has provided an excellent alternative to the use of chemical solvents. The present commentary provides an overview of different techniques using supercritical fluids and their future opportunity for the drug delivery industry.

The unique physical properties of supercritical fluids, having values for density, diffusivity and viscosity values between liquids and gases, enables supercritical fluid extraction to be used for the extraction processes which cannot be done by liquids due to their high density and low diffusivity and by gases due to their inadequate density in order to extract and carry the components out.
